

RAMBOLL

DIGITAL SERVICES ICT/BIM MANAGEMENT

At Ramboll, ICT (Information and Communication Technology) is a focal point in our design process. ICT supports better coordination and collaboration, and it is an integrated part of the design process.

A holistic approach

Ramboll has worked with digital design tools for more than 10 years. The processes have been optimised over the years. Our holistic approach focuses on the entire lifecycle of buildings. Data for operations and maintenance can be included in the digital models, also in the early phases. ICT makes it easier to organise information so it can be used throughout the lifecycle of a building, and not only during the design and construction phases.

ICT Management

Ramboll can offer various ICT services. A Ramboll BIM/ICT Manager can serve as a specialist for a given project.

A Ramboll specialist can also assist if a client needs help when listing ICT demands or when making an ICT agreement for a given project. Ramboll can facilitate the dialogue with external consultants both as part of the client organisation or by working as client consultant.

Ramboll's experience

Business Information Modelling (BIM) is a natural part of Ramboll's building projects. Ramboll has an integrated group of BIM specialists who provide technical support and ensure that proper technical solutions are used at all times. At Ramboll we concentrate on tailoring the digital solutions to suit the specific project type, project size and any client demands. Ramboll takes active part in national and international BIM conferences as speakers and participants. We also participate in national and international networks, all to ensure that we can provide our clients with

the best solutions when it comes to BIM and ICT.

ICT BRINGS NEW OPPORTUNITIES

ICT is a common term for digital collaboration. Digital collaboration between disciplines helps to ensure that the practical and technical aspects of the project work together in the same direction. This can include the use of 3D models at meetings and workshops to support shared understanding and to facilitate collaboration between disciplines. ICT supports progress and productivity by using digital tools to match expectations, visualize and communicate design solutions. In our perspective ICT helps minimize project risks.
